

“Soul Transfer” Social Networking android application

“Soul Transfer” android app concept is the accomplishment result of 20 years of solo research on Schizophrenia, mental illness, sleep disorder, depression, Internet addiction and social telepathy. In this concept, it is a formalised belief that human interaction both offline and online leads to certain transformation in the mind which can be termed as soul transfer, leading to both positive and negative moods of individuals leading further to sleep disorder and anxiety.

The solution of social anxiety is addressed in the implementation of **“Soul Transfer”** in the form of an android application which collects small talk audio voice clips ranging from 1 second to 60 seconds uploaded by the app users with long pressing either of the two PRESS buttons, so called “share problem” and “share solution” separately according to appropriate mental mood state of the user, thereby other users in their geographic locality been able to listen to those positive moods affecting audio voice clips and negative moods affecting audio voice clips shared by collective users in the geographic locality of 1 k.m radius with an algorithm developed to search and play audio clips in the 1 k.m. radius locality appropriate to the user from the standpoint of the user’s android smartphone.

The best part of the **“Soul Transfer”** android app is that users who like to travel around the world would get to know the problems and solutions shared by local users thereby getting enlightenment about life and problems we can solve as humans collectively for each other globally. Also, users sitting at the comfort of home will be able to know neighbour’s problems and provide solutions in addition to emotional support and vice-versa will be able to share problems in the form of audio voice clips with neighbours sitting at home.
